A gimbal mount provides rotation without translation. It has axes of rotation which intersect at the center front surface of the optic. These mounts are designed to eliminate angular or positional crosstalk when steering a beam of light.

Optical Tube System 80

Holmarc's Lens Tubes System allow the combining of several optical components into stable and rigid assemblies. Lens tubes are ideal for creating compact optical sub-assemblies. Optics are separated and secured by retaining rings that are positioned at the desired depth within the lens tube

Lens tubes can be used to create lens systems such as beam expanders, telescopes, microscopes, or collimators. Various lengths of tubes for holding 1/2, 1 and 2 inch diameter lenses as well as adaptors for mounting other types of components are available.

Iris and Apertures 107

Apertures are used to limit the amount of light that is exposed to imaging sensors or photodetectors for a range of laser or imaging applications. Apertures are optical components comprised of irises, pinholes, or slits designed to block certain portions of a light source from reaching photodetectors in order to prevent over saturation or damage. Apertures may be controlled by expanding or contracting the diameter or width of the opening to fit multiple applications or environments, making Apertures versatile light blocking choices.

CONFOCAL LASER RAMAN SPECTROMETER

Model : HO-ED-SP-CRM215

Confocal light collection
High lateral spatial resolution
Excellent depth resolution

Large collection angle for the Raman light

Raman microscopy integrates a spectrometer to a standard optical microscope, allowing magnified visualization of sample and analysis with a microscopic laser spot. In confocal Raman microscope, measurements are comparatively easier. What is required is to place the sample under the microscope, focus, and take a measurement.

The Raman effect occurs when light impinges upon a molecule and interacts with the electron cloud and the bonds of that molecule. For the spontaneous Raman effect, which is a form of light scattering, a photon excites the molecule from the ground state to a virtual energy state. When the molecule relaxes it emits a photon and returns to a different rotational or vibrational state. The difference in energy between the original state and this new state leads to a shift in the emitted photon's frequency away from the excitation wavelength. Confocal Raman microscopy refers to the ability to spatially filter the analysis volume of the sample, in the XY (lateral) and Z (depth) axes.
